

TOE-TEST-0053 Report

****Question:**** Can Flamehaven-LOGOS be used safely as an offline TOE candidate sidecar?

****Verdict:**** 'DEGRADED_SIDE CAR_ONLY'

Baseline Comparison

Baseline Method Files Python Manifest
--- --- --- --- ---
TOE-TEST-0051 governance scaffolding 1 False False
TOE-TEST-0052 executable analysis plus SPAR review 9 True False
TOE-TEST-AEFSO staged artifact-first experiment 28 False True

LOGOS Detection

- Source syntax: '6/6' key files compile.
- Python package name 'logos' resolves to: 'D:\Sanctum\RExSyn-Nexus-main\src\logos__init__.py'
- Direct Flamehaven-LOGOS import status: 'timeout'
- AATS smoke status: 'timeout'
- TOE sidecar/report contract tests: 'pass'

Interpretation

The prior TOE-TEST pattern supports creating a distinct 'TOE-TEST-0053' cell. AEFSO is the best structural reference because it is a staged artifact-first experiment, while TOE-TEST-0052 contributes the executable analysis-script pattern.

LOGOS is present and source-valid, but runtime use is not yet clean if package resolution points at a different 'logos' package or direct imports time out. Therefore LOGOS remains an offline candidate generator until a compatibility adapter and import-latency fix are verified.

Output Artifact Check

This run emits Markdown, HTML, PDF, JSON, a sample candidate packet, and a manifest. HTML is the primary review artifact; PDF is a static review copy; Markdown is the editable text report; JSON is the machine payload.

Non-Claims
